Contribution Journal

Brian's Contribution

In the lab, I worked through the notebook cells, tried to understand and code the different stages of the machine learning workflow, and connected them to the bigger picture of machine learning. I participated in working with the Titanic dataset, preparing the features and target, training the logistic regression model, and reviewing how the model generated predictions. I also contributed to commenting on the code in my sections, so running and editing code would be easier to understand. I worked with Toan and Montserrat to run the notebook cells and review the outputs together. I also helped check the workflow did progress correctly from model training to even model evaluation. Through the process, I improved my understanding of how a model's predictions can be evaluated using more than just one performance metric. I also contributed by reviewing the completed notebook and making sure the work was organized and understandable.

Toan's Contribution

I contributed to completing and reviewing the code used to evaluate the model. I worked through my assigned parts of the notebook and added comments explaining the purpose of the code in my sections. I also participated in reviewing the confusion matrix and classification report to understand how the model's predictions compare with the actual outcomes.

I worked with Brian and Montserrat to execute the notebook cells and examine the results together. We reviewed the evaluation of metrics and discussed how precision, recall, and the F1-score provide different information about model performance. My contribution included helping make the evaluation process understandable and checking that the outputs matched the intended purpose of the lab. This work helped me better understand how different types of prediction errors affect the interpretation of a machine learning model.

Montserrat's Contribution

I contributed to the lab by working through the notebook code, reviewing my sections, and adding comments to explain the code's purpose. I also participated in completing the evaluation workflow and understanding how the model's performance was measured. I reviewed the cross-validation section to understand how the model could be evaluated using multiple folds rather than relying only on one train-test split.

I worked with Brian and Toan to run the notebook cells and review the outputs together. We discussed the results, checked the workflow, and considered how the different evaluation methods contributed to a better understanding of model performance. My contribution also included participating in the review of the completed notebook and helping ensure that the code and outputs were presented clearly. Through this process, I developed a better understanding of why cross-validation and multiple evaluation metrics are useful when assessing a machine learning model.
